After 10 traveling among different distros, I came to Stella / Centos from Fuduntu. The only downside was my BCM4313 wireless device not recognized. After a 3-day struggle I found the following thread:

<http://www.linuxforums.org/forum/wireless-internet/177469-so-lved-wireless-scientific-linux-6-help-3.html>

Now I am really grateful for Stella team for the good job they did.

I think this should be included in the current build files

PS. Attached is the RPM I built using latter3 instructions to solve the problems with many broadcom wireless devices using the kmod-wl built for Centos / Stella / SL 6.3 (64 bit)
