I recently started using Stella and it is the best distribution I have used so far. To make it my primary OS, I was looking for a flash cards package that I regularly use, Anki (ankisrs.net)

I installed old version of the package from naulinux repository, but it is lacking lot of new features of Anki 2

So, I was wondering if anyone else successfully installed the newer version of the package in Stella, if so please let me know the procedure.

Thank you very much for your help.

Hello,

Thanks for your kind words.

Anki2 requires PyQT 4.7+, EL6 comes with PyQT 4.6.. so it will not work. Sorry.

Hi nux,

Thank you very much for the quick reply. I will probably dual boot Stella 6.5 and Fedora 20.

Thanks.

That might be one way of solving this, Fedora 20 is a great release imho.

If you are technical and like to get your hands dirty, you can try running Anki under a Fedora

docker[1] instance. ;)
