Hi there:)

Installed Stella 6.7 on a friend's old i386 laptop I thought needed some reviving. Everything runs absolutely fine, but the English language interface is troublesome to him because he does not speak English. How can I add the French language pack to Stella so that everything appears in French? I cannot seem to find any program to do so in the Stella menus or interface. Should I add any specific package, either by command line or through Yumex?

Thanks a lot.

Hi,

curiously enough I can't find a standalone application that does that, however this can be chosen at login time, see the screenshot attached.
