Hi,

I'm trying to install vlc on CentOS 7 using yum, but since recently it gives a dependency issue:

```
Error: Package: 1:vlc-core-2.2.5.1-2.el7.nux.x86_64 (li-nux-ro)
Requires: liba52.so.0()(64bit)
```

I have added both epel-release en li.nux.ro repository installed (and of course the CentOS repositories). Is this an issues with the package dependencies or am I missing some other required repository?

Hello,

Can you paste the full yum output please? I can't replicate this issue.

Thanks, I was having a hard time trying to pinpoint the cause. But I found out (thanks to your answer) that the problems was caused by the epel mirror I used, which was having problems.

My apologies for the confusion.
