Hi, Nux

I install vlc (vlc, vlc-core, gnome-vfs2) on centos 7.4

It will cause first time open nautilus slowly

until I force rpm -e gnome-vfs2 --nodeps which if form base repo.

I'm curious is that necessary dependency?

Hello,

That dependency is automatically added by rpm (AutoReqProv), but since there are not more complains about it, I can only assume the slowness is particular to your system for whatever reason.

I just tested myself and nautilus works fine, even though I also have that package installed.
