Hello,

When I attempted to upgrade from CentOS 7.4 to 7.5 I received the following error message re. gnome-commander which I have installed from your nux-dextop repo. Error: Package:
4:gnome-commander-1.8.1-2.el7.nux.x86_64 (@nux-dextop)
Requires: libexiv2.so.12()(64bit)
Removing: exiv2-libs-0.23-6.el7.x86_64 (@base)
libexiv2.so.12()(64bit)
Updated By: exiv2-libs-0.26-3.el7.x86_64 (cr)
~libexiv2.so.26()(64bit)

I fired up a virtual machine on which I had manually built and installed gnome-commander. Same message when I attempted to update to CentOS 7.5. I uninstalled gnome-commander, upgraded to CentOS 7.5, rebooted and then ran configure, make, make install. gnome-commander seems to be running fine.

Would you be kind enough to repackage gnome-commander 1.8.1 on a CentOS 7.5 machine and place it in your testing repo? I will then be happy to test it on CentOS 7.5 and during an upgrade from 7.4 to 7.5.

Thank you,

Ken Taylor

You beat me to it :blush: I went to pull down a gnome-commander rpm manually from your repo to do some testing. I found gnome-commander-1.8.1-2.el7.nux.x86_64.rpm which appears to have been built yesterday.

I have tested it a couple of ways and it seems to have fixed the dependency issue perfectly.

Thanks again,

Ken Taylor
