I have several desktop units with aeskulap that is being used to review dicom images. When Centos recently upgraded from 7.5 to 7.6 all of the aeskulap Centos 7.6 units fail to access our pac server which uses orthanc. All of the desktops that do not use Centos 7.6 still remain active.

The 'Echo Test' fails to make an association, and when an attempt is made to access the pac server the response is "No results for this query".

I surely appreciate your maintaining aeskulap, and would greatly appreciate your help.

Thank you,

Greg Ennis

Hi Greg,

Sorry to hear that. I tried to rebuild the package on 7.6 as well as build a newer version, but none seems to compile any more.

Have you tried enabling/disabling selinux, see if that makes any difference?

Can you try to launch aeskulap from a terminal, see if it outputs any errors there while you are working with it?

I am merely a packager and do not have access to this kind of images or ecosystem, so testing is limited.

Thank you for your help!!!!

When aeskulap is executed from the gui or the command line it appears to execute normally. The problem is only identified when I try to access dicom files from the pac server. I am using

'orthanc' as the pac server on a different machine in the network. orthanc appears to be functioning normally. I downloaded an iso of Fedora29 last night to see if aeskulap would work with it, and it works perfectly with Fedora29.

Here are the results of the verbiage that occurs with the command line execution. I never really studied the command line information before, but it does not look like there is much difference between today's and what has occurred in the past.

Thank you again for your help with this.

Greg

I have now disabled selinux on my aeskulap machine and this process made no difference. I subsequently turned off selinux on the pac server and tried aeskulap on my desktop both unites of which had selinux disabled and there were no changes. It does not look like selinux is the problem

Thank you again for your help. I am going to be out of town and will not have computer access while I am gone. If I can do anything on my end to help you, let me know.

Thanks much!!!

Greg

Greg,

I'll be off as well for a few days.

Have you looked at alternative applications?

There are some other dicom linux viewers but none that have been compiled for Centos, aeskulap was the only one I have identified. My hope was to try to get aeskulap to work on Centos 7.6 because it does a great job for our needs.

Is there anything you can tell me as to why it did not compile on 7.6, I will post a message on the Centso user's mail list to see if anyone can help. I presume you have the source code on your repo, I also plan to download and try to compile it myself to see if I get the same errors that you did.

Hope you had a rewarding Christmas!!!

Thanks for your help!!!!

Greg Ennis

If some other dicom client caught your eye, let me know and we'll try to package it. About Aeksulap, it might be worth more to open an issue with the developers instead of the CentOS mailing list.

Can you try a small test, maybe we can fool Aeskulap to run properly.  
Here are the deps of the app from 7.5: <http://tmp.nux.ro/aeskulap-el75-deps.tar.gz>

Can you unpack them somewhere, go in that dir and then run the app like this:  
export LD\_LIBRARY\_PATH=`pwd`  
/usr/bin/aeskulap
