
Subject: Using infinality packages on CentOS 7.6

I've been using the freetype-infinality and fontconfig-infinality RPMs on several CentOS 7 workstations, and they've greatly improved the look of the desktop (I'm running MATE).

I saw several errors during the CentOS 7.5 -> 7.6 upgrade, such as:

When fonts are installed or upgraded that run "fc-cache":

```
# fc-cache
Fontconfig error: failed reading config file
Fontconfig error: Cannot load config file "infinality/conf.d"
Fontconfig error: failed reading config file
Fontconfig error: Cannot load config file "infinality/conf.d"
```

Also, when the "librsvg2" RPM is upgraded, which has the following RPM scriptlet:

```
/sbin/ldconfig
gdk-pixbuf-query-loaders-64 --update-cache || :
```

Running this gives:

```
# gdk-pixbuf-query-loaders-64 --update-cache || :
g_module_open() failed for /usr/lib64/gdk-pixbuf-2.0/2.10.0/loaders/libpixbufloader-svg.so:
/lib64/libcairo.so.2: undefined symbol: FT_Get_Var_Design_Coordinates
```

It looks like freetype was upgraded in CentOS 7.6, and the need for the infinality RPMs may not be as crucial as before, but I still like the appearance with infinality installed. I've seen references to "freetype-freeworld" as a potential replacement, but I didn't see too much difference between a stock CentOS 7.6+MATE desktop, and one with the freetype-freeworld RPM installed.

Does one or both of the "freetype-infinality" or "fontconfig-infinality" RPMs need to be rebuilt for CentOS 7.6 to address the undefined symbol error above? (And possibly for the "Cannot load config file" issue I mentioned earlier?)

thanks for this terrific repo!

-Greg

Hi,

Yes, I would suspect the infinality packages need updating to a compatible freetype version; the problem is I am not sure they are even maintained any more.

BTW, I am removing these packages from the repo until a solution is found, if at all.
