A while ago, a newer Remmina version was made available here:

<http://li.nux.ro/download/nux/tmp/remmina-el7/>

Now it's been a while since last time, so it would be nice with a refresh. I run the version provided, but sometimes the session freezes abnormally.

By the way, in the normal nux-dextop repo, remmina is at version:

remmina-1.0.0-8.el7.nux.x86_64.rpm

Even the version currently under tmp folder is way more stable than 1.0.0-8.

Ok, so that would mean that Remmina will be found in EPEL repo in the future?
